

Diabetic Hallux Wound

PATIENT INFORMATION:

52-year old male

WOUND HISTORY:

Ulcer on his left hallux that had been present for 9 months. He reported the ulcer first appeared as a blister from a pair of tight fitting shoes. Previous treatments included daily silver sulfadiazine dressing changes and weekly debridement. The wound extended to bone and required aggressive bedside debridement.

DIMENSIONS:

Prior to SNAP™ Therapy, the wound measured 9mm x 8mm with a depth of 20mm without undermining.

COMORBIDITIES:

10-year history of diabetes mellitus.

SNAP™ THERAPY TREATMENT:

The patient was started on SNAP™ Therapy to fill in wound. At week 5, SNAP™ Therapy was discontinued due to the small size of the wound, and a cellular tissue product was applied. The patient was continued in a postoperative shoe and crest pad.

OUTCOME:

One week after the cellular tissue product application, at patient follow-up the ulcer was completely epithelialized. He was followed for an additional two months at increasing intervals and the ulcer remained healed.

Start of SNAP™ Therapy

Week 5

Week 8
